Mean 30.310; Variance 51.743; scale 0.586 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

Thu Jul 30 09:32:10 1998; MasPar time 1.21 Seconds 159.253 Million cell updates/sec : ao

>US-08-938-548A-11 (1-33) from US08938548A.pep 256 1 QPLPDCCRQKTCSCRLXELLHGAGNHAAGILTL 33 abular output not generated. Title: Description: Perfect Score: Sequence:

PAM 150 Gap 11 Scoring table:

63816 seqs, 5850866 residues

Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

a-issued 1:5\_COMB 2:PCT9\_COMB 3:backfiles

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 21.451; Variance 82.349; scale 0.260

Statistics:

## ALIGNMENTS

transplant to humans
Claim 3; Page 12-14; 20pp; Japanese.
This protein is a porcine complement inhibitor encoded by pMCPcDNA
(T61098). The DNA is useful for large scale production of
recombinant porcine complement inhibitor, which is useful for
porcine organ transplantation into humans. The DNA clone pMCPcDNA is
also useful in the analysis of the promoter region of porcine complement
inhibitor. DNA encoding porcine complement inhibitor – useful in porcine organ W12414;

New agouti signal protein peptide(s) and nucleic acids - used for altering melanin prodm., for treating e.g. melasma photo-ageing spots, solar keratosis or vitiligo claim 10; Page 11; 67pp; English.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced emplanogenesis, for treating eg, vitiligo, leucoderma, some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          18-5EP-1997 (first entry)

                                                                                                                                 DNA corresp. to (part of) foot and mouth disease virus RNA - useful in prepn. of vaccines for producing antibodies against the virus Example; Fig 6; 57pp; English.

The inventors claim a DNA molecule comprising a nucleotide sequence corresp. to all or a portion of foot-and-mouth disease virus RNA (FMDV). The DNA molecule is esp. for a precursor of FMDV capsid protein. It esp. codes for FMDV protein p88 and VPI-VP4. It may code for vp4, VP2, vp3 and VPI contiguously. The inventors also claim a vaccine for stiumlating prodn. of antibodies against FMDV in a mammal which comprises at least one of the above recombinant proteins produced by a host cell transformed with the DNA.

A deficiency of the enzyme results in galactosaemia. The amino acid sequence of UDP-G4E was deduced from a cDNA clone (T58301) derived from a human endometrial tumour library. Recombinant UDP-G4E polypeptides can be produced in transformed host (e.g. E. coli, COS, Sf9 insect) cells or expressed in vivo for use in the treatment of UDP-G4E deficiency, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

particularly plants for the control of nematodes claims therefore the control of nematodes claims 4; Page 35-39, 44pp; English.

Claim 4; Page 35-39, 44pp; English.

This sequence represents the protein encoded by a polynucleotide of the invention. The polynucleotide of the invention is a sequence from a Bacillus thuringiensis (Bt) isolate selected from PS80/J1, PS158D5, PS167P, PS177F1, PS177G, PS204G4 and PS204G6, that encodes a toxin active against nematodes. This sequence represents the 167P protein, and is a delta-endotoxin protein. The polynucleotides and toxins can be used for the control of nematode pests such as Panagrellus Sequence 1167 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                           New agouti signal protein peptide(s) and nucleic acids - used for altering melanin prodn., for treating e.g. melasma photo-ageing pepts, solar keratosis or vitiligo
Claim 5; Page 8-9; 67pp; English.
The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some forms of albinism and hair greying.
    Agouti signalling protein; ASP; depigmenting activity; cosmetic; hyperplymentary condition; melasma photcoageing spots; solar Keratosis; post-inflammatory hyperplymentation; wound healing; eumelanogenesis; vitiligo; leucoderma; albinism; hair greying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nematcode toxin 167P protein.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammantory hyperpigmentation such as occurs at sites of wound healing. They can also be used to provide enhanced emmelanogenesis for treating eg. vitiligo, leucoderma, some
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        17-SEP-1997 (first entry)

Human agouti signalling protein.

Example; Page 17; 28pp; English.

The sequence is that of a polypeptide present in fraction K of the venom of Agelenopsis aperta, it blocks calcium channels in cells of both mammals and invertebrates, partic. those affecting neuronal and muscle cells. It may be used in the treatment of angina, hypertension, cardiomyopathles, supraventricular arrhythmia, oesophogeal achalasia, premature labour, and Raynaud's disease. It may also be of use in the study of cell physiology and in the control of invertebrate pests. It may be produced synthetically.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

##note the authors translated the codon CAG for residue 430 as
##note His and GGG for residue 431 as Pro
NT This protein is the functional homolog of the principal sigma
factors involved in the transcription of housekeeping genes.

    Streptomyces

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcription initiation factor sigma hrdB - Streptomyces
                                                                                                                                                                                Shiina, T.; Tanaka, K.; Takahashi, H. Gene (1991) 107:145-148
Sequence of hrdB, an essential gene encoding sigma-like
transcription factor of Streptomyces coelicolor A3(2):
homology to principal sigma factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                #superfamily transcription initiation factor sigma katf; transcription initiation factor sigma katf homology

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.311; Variance 47.835; scale 0.655

BIOCHTH. BIOPHYS. ACTA 1144:102-106(1993).

C -!- CATALYTIC ACTIVITY: 4(2)S + 3 OXIDIZED FERREDOXIN + 3 H(2)O = SULFITE + 3 REDUCED FERREDOXIN.

-!- COFACTOR: THIS ENZYME CONTAINS ONE SIROHEME AND ONE 4FE-4S IRON-SULFUR CENTER AS PROSTHETIC GROUPS.

-!- SUBUNIT: MONOMER AS PROSTHETIC GROUPS.

-!- SIMILARITY: THE C-TERMINAL DOMAIN IS A 4FE-4S/SIROHEME DOMAIN FOUND IN NITRITE REDUCTASES (EC 1.6.6.4 AND EC 1.7.1) AND SULFITE REDUCTASES (EC 1.8.1.2 AND EC 1.8.7.1).

Mean 29.753; Variance 52.286; scale 0.569 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENE 122:63-70(1992).
-1- FUNCTION: THE SIGMA FACTOR IS AN INITIATION FACTOR THAT PROMOTES
ATTACHMENT OF THE RNA POLYMERASE TO SPECIFIC INITIATION SITES AND
THEN IS RELEASED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EMBL; M90411; G153306; -.

Mean 21.977; Variance 87.361; scale 0.252 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

## ALIGNMENTS

Retinoid X receptor (RXR) interacting protein (RIP) - useful to modulate or mediate RXR function, anti-RIP antibodies can be used to determine RIP subcellular distribution patterns
Claim 2: Page 48-50: 90pp; English.

Mouse retinoid X receptor (RXR) interacting protein RIP110 (R99737) is a candidate transcriptional co-activator. It was identified using an in vivo interaction trap system for the isolation of proteins that physically interact with RXRs, esp. with the ligand binding domain of human RXR alpha. Recombinant RIP110 can be obtd. using a cDNA clone (T31930) obtd. from a mouse liver library. RIPS (see also R99735-36 and R99738-39) can be used to modulate or mediate RXR function, and may be used therapeutically or to raise antibodies. R99737;

                                                                                                                                                                               Claim 15; Page 42-50; 78pp; English.

The sequences given in W21731-32 represent fusion proteins which contain NuMA (nuclear mitotic apparatus). The fusion proteins were used in the identification of NuMA interecting proteins (NIP's) (see also W21729-30). Compounds which interfere with the interaction of NuMA (w21729-30). Compounds which interfere with the interaction of NuMA (w1729-30). Compounds which interfere with the interaction of NuMA (with a known NIP are used to modulate cell division and/or proliferation. Ab, raised conventionally using NIP-1 or -2 as immunogen, are used to detect NIP (or their complexes) and to block their activity for detect in the complexes and to block their activity for their complexes and to block their activity for their aberrant (including malignant) cell growth (which can also be detected by nucleic acid sequencing). Also where malignancy is related to defects in NuMA or NIP, it can be treated by administration of the appropriate functional protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in W2171.32 represent fusion proteins which contain NWAA (nuclear mitotic apparatus). The fusion proteins were used in the identification of NUMA interecting proteins (NIP's) (see also W21729-30). Compounds which interfere with the interaction of NUMA with a known NIP are used to modulate cell division and/or proliferation. Ab, raised conventionally using NIP-1 or -2 as immunogen, are used to detect NIP (or their complexes) and to block their activity for diagnostic or therapeutic use, e.g. to detect defective NUMA or NIP which may be markers for aberrant (including malignant) cell growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              W21731;

Claim 55; Fig 23; 91pp; English.

Solypeptide sequences (W19629-30 and W00918) can be deduced from
3 Polypeptide sequences (W19629-30 and W00918) can be deduced from
4 the vep ORF1 polyketide synthase (PKS) gene cluster (T68715) of
5 streptomyces venezuelae. The sequence data indicate that the PKS
5 gene cluster encodes a polyene of 12 carbons. The vep gene cluster
6 contains 5 PKS modules, plus a 5' loading module and a 3' end
7 contains 5 PKS modules, plus a 5' loading module and a 3' end
8 contains 5 PKS modules, plus a 5' loading module and a 3' end
8 contains 5 PKS modules, a keto-reductase and an acyl carrier
8 protein domain. A novel expression cassette encoding the first
8 protein domain. A novel expression cassette encoding the first
8 module from the vep gene cluster and module 7 from the Streptomyces
8 cylly gene cluster has polyhydroxyalkanoate (PHA) monomer synthase
8 activity and can be used for PHA prodn. in host (esp. insect) cells
9 for use as a biodegradable polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                ö
(which can also be detected by nucleic acid sequencing). Also where malignancy is related to defects in NuMA or NIP, it can be treated by administration of the appropriate functional protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Recombinant alveolar surfactant protein - used for treating respiratory distress syndrome and related diseases e.g. pneumonia and bronchitis.

Disclosure; pp; English.

The sequence was deduced from clone pHS10-4, isolated from a busclosure pp; English.

The protein is part of the alveolar surfactant protein, high mol. wt, hydrophilic 32K gp. The protein differs at 7 positions from a previously published (WO8603408) sequence, and also at several places from two other sequences cetermined by others. It is believed that the 32K human ASP protein may be encoded by multiple genes. The recombinant protein can be used for the treatment of respiratory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Regulatable expression systems - contg. human metallo:thionein-II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   31-JUL-1991 (first entry)
Genomic sequence of human alveolar surfactant protein (hASP)
encoded by genomic DNA, used to obtain pASPcg-SV(10)
Regulatable expression system.
Homo sapiens.

A regulatable expression system for a coding sequence is.
The system can process genomic as well as intronless DNA.

                                                                                                                  Disclosure: pp; English.

The sequence was deduced from clone pHS10-5, isolated from a human lung cDNA library. The protein is part of the alveolar surfactant protein, high mol. wt, hydrophilic 32K sp. The protein differs at position 50 from a previously published (W08603408) sequence, and differs at several places from two other sequences determined by others. It is believed that the 32K human ASP protein may be encoded by multiple genes. The recombinant protein can be used for the treatment of respiratory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pulmonary surfactant proteins - used for treating Hyaline Membrane Disease or Respiratory Distress Syndrome. Claim 1; Page 34A-B; 50pp; English.
                                                      Recombinant alveolar surfactant protein - used for treating respiratory distress syndrome and related diseases e.g. pneumonia and bronchitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gene product may be used in treatment of Hyaline Membrane Disease
and Respiratory Distress Syndrome (RDS) in both premature infants
and adults eg. cardio-pulmonary operations. The protein products
may also be used to raise diagnostic antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 14, Application US/07921848
Patent No. 5292646
GENERAL INFORMATION:
APPLICANT: McCoy, John
APPLICANT: Lavallie, Edward
TITLE OF INVENTION: Peptide and Protein Fusions To
TITLE OF INVENTION: Thioredoxin and Thioredoxin-Like Molecules
NUMBER OF SEQUENCES: 24
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 31.693; Variance 44.992; scale 0.704

DNA encoding porcine complement inhibitor - useful in porcine organ transplant to humans claim 3; Page 12-14; 20pp; Japanese.

This protein is a porcine complement inhibitor encoded by pMCPCDNA (T61098). The DNA is useful for large scale production of recombinant porcine complement inhibitor; which is useful for porcine organ transplantation into humans. The DNA clone pMCPCDNA is also useful in the analysis of the promoter region of porcine complement

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human mature unidate diphosphate galactose-4-epimerase (UDP-G4E) (W01619) catalyses a reversible reaction between UDP-glucose and UDP-galactose to atlance allows galactose residues to enter into the main pathways of glucose metabolism. A deficiency of the enzyme results in galactosaemia. The amino acid sequence of UDP-G4E was deduced from a cDNA clone (T58301) derived from a human endometrial tumour library. Recombinant UDP-G4E polypeptides can be produced in transformed host (e.g. E. coli, COS, Sf9 insect) cells or expressed in vivo for use in the treatment of UDP-G4E deficiency, e.g.
                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                            DNA correspo. to (part of) foot and mouth disease virus RNA - useful in prepo. of vaccines for producing antibodies against the virus Example; Fig 6: 57pp: English.

The inventors claim a DNA molecule comprising a nucleotide sequence corresp. to all or a portion of foot-and-mouth disease virus RNA (FMDV). The DNA molecule is esp. for a precursor of FMDV capsid protein. It esp. codes for FMDV protein p88 and vPl-VP4. It may code for VP4, VP2 VP3 and VP1 contiguously. The inventors also claim a vaccine for stiumlating prodn. of antibodies against FMDV in a mammal which comprises at least one of the above recombinant proteins produced by a host cell transformed with the DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hyperpigmentary conditions and diseases such as melasma photoageing spots, solar keratosis, and post-inflammatory hyperpigmentation such occurs at sites of wound healing. They can also be used to provide enhanced eumelanogenesis for treating eg. vitiligo, leucoderma, some

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pacillus thuringlensis toxin gene - useful in recombinant hosts, particularly plants for the control of nematodes Claim 4; Page 35-39; 44pp. English.

Claim 4; Page 35-39; 44pp. English.

This sequence represents the protein encoded by a polynucleotide of the invention. The polynucleotide of the invention is a sequence from a Bacillus thuringlensis (Bt) isolate selected from PS80JJ, PS158D5, PS167P, PS169P, PS177FI, PS177G, PS204G4 and PS204G6, that encodes a toxin active against nematodes. This sequence represents the 167P protein, and is a delta-endotoxin protein. The polynucleotides and toxins can be used for the control of nematode pests such as Panagrellus
Agouti signalling protein; ASP; depigmenting activity; cosmetic; hyperpigmentary condition; melasma photoageing spots; solar keratosis; post-inflammatory hyperpigmentation; wound healing; eumelanogenesis; vitiligo; leucoderma; albinism; hair greying.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              NOT-APR-1998 (first entry)
Nematode toxin 167P protein.

The sequences given in W10101-29 are biologically active peptides and fragments of the agouti signalling protein (ASP) which have depigmenting activity. These peptides are useful for cosmetic purposes and for clinical application in the prevention or treatment of various hyperpigmentary conditions and diseases such as melasma photoageing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human agoutt signalling protein.

Agoutt signalling protein; ASP; depigmenting activity; cosmetic;

hyperpigmentary condition; melasma photoageing spots; solar keratosis;

post-inflammatory hyperpigmentation; wound healing; eumelanogenesis;

vitiligo; leucoderma; albinism; hair greying.
               Example; Page 17; 28pp; English.

The sequence is that of a polypeptide present in fraction K of the venom of Agelenopsis aperta, it blocks calcium channels in cells of both mammals and invertebrates, partic. those affecting neuronal and muscle cells. It may be used in the treatment of angina, hypertension, cardiomyopathies, supraventricular arrhythmia, oesophogeal achalasia, premature labour, and Raynaud's disease. It may also be of use in the study of cell physiology and in the control of invertebrate pests. It may be produced synthetically. Sequence 48 AA;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
